Introducing Customized *hyb*CPG™ Sample Kits
ONLY $150.00!

*Hyb*CPG™ is our patented new approach to solid phase oligo synthesis supports, combining the advantages of controlled porosity glass (CPG) and polystyrene. It provides high nucleoside loadings in a non-swelling format, for the highest possible volumetric efficiency. The unique design of *hyb*CPG™ minimizes the trade-off between pore size and loading capacity, opening new possibilities in oligo synthesis.

Explore how *hyb*CPG™ can work for your synthesis with our customizable Sample Kits, that allow you to conveniently order 7 gram test quantities of three different supports of your choice- enough for three 6.4 ml syntheses, for each sample. Choose from three pore sizes, eight nucleosides or the amine form for further derivitization* (at your place or ours), and three different loading ranges. Visit www.primesynthesis.com for more information about *hyb*CPG™.

 Our special low introductory price and Sample Kit Order Form makes it all easy.

* 3'-modifications, Universal linkers, or customer provided ligands can be provided at extra cost.
